

Thomas Albertsen's lounge chair

Emission:

100 kg of CO₂eq

Comments on the result

Here you can see that the biggest impacts stems from the materials and production. In this case, it is mostly the textile but and wood-based board that carry most of the material emissions. The production emissions primarily come from the spinning and weaving of the textile, because these processes require high amounts of energy.

Disclaimers:

We assume that metals, plastics and textiles are produced according to the global average unless we know differently.

All other materials are assumed to be produced in the EU

We assume a transport distance by lorry from supplier to warehouse of 1,000 km

We assume a transport distance from warehouse to final client of 1,000 km

Målbar builds their assumptions on their experience with industrial production and LCA's on manufacturing companies.
